The Motion Stark Effect			
The Motion S	tark Effect (MSE)	

The Motion Stark Effect (MSE)

In fusion devices, like tokamaks, Neutral Beam Injectors (NBI) insert high-energy neutral atoms inside the magnetic confined plasma.

As the atoms are neutrals, they do not react as a hole system to these magnetic fields, being able to penetrate deeply into the plasma until they are ionised.

- Internally, the neutrals can fell simultaneous electric and magnetic fields, which disturb their electronic structure.
- The atom is moving rapidly under an intense magnetic field, what causes a Lorentz electric field.
- The atom is under the influence of simultaneous electric and magnetic fields.

Stark effect in neutral hydrogen by direct integration of the Hamiltonian in parabolic coordinates

L. Fernández-Menchero1,2 and H. P. Summers1

¹Atomic Data and Analysis Structure, Department of Physics, University of Strathclyde, 107 Rotnerrow East, Glasgow G4 0NG, United Kingdom ²Max-Planck-Institut für Plasmaphysik, Boltzmannstraße 2, D-85748 Garching, Germany (Received 18 June 2013; published 19 August 2013)

We present a theoretical study to determine the energies, widths, and wave functions of the neutral hydrogen atom under a constant electric field by the direct integration of the Hamiltonian in parabolic coordinates. We work in terms of the complex coordinate rotation to distinguish the resonances from the continuum sea, and the wave functions are expanded in a basis set of Laguerre-mesh polynomials. We obtain *ab initio* results for the first five atomic shells of neutral hydrogen for a field intensity up to $10^{\circ} V/m$.
